

SOLVED PAPER

AIIMS - 2009

Time : 3½ hours

Max. Marks : 200

PHYSICS

- A convex lens of refractive index $\frac{3}{2}$ has a power of 2.5 D in air. If it is placed in a liquid of refractive index 2, then the new power of the lens is
 (a) -1.25 D (b) -1.5 D
 (c) 1.25 D (d) 1.5 D
- What is ratio of Bohr magneton to the nuclear magneton?
 (a) m_p/m_e (b) m_p^2/m_e^2
 (c) 1 (d) $\frac{m_e}{m_p}$
- When the inputs of a two input logic gate are 0 and 0, the output is 1. When the inputs are 1 and 0, the output is zero. The type of logic gate is
 (a) XOR (b) NAND
 (c) NOR (d) OR
- de Broglie wavelength λ associated with neutrons is related with absolute temperature T as
 (a) $\lambda \propto T$ (b) $\lambda \propto \frac{1}{T}$
 (c) $\lambda \propto \frac{1}{\sqrt{T}}$ (d) $\lambda \propto T^2$
- The dimensions of specific resistance are
 (a) $[M L^2 T^{-2} A^{-1}]$ (b) $[M L^3 T^{-3} A^{-2}]$
 (c) $[M L^3 T^{-2} A^{-1}]$ (d) $[M L^2 T^{-2} A^{-2}]$
- Reciprocal of impedance is
 (a) susceptance (b) conductance
 (c) admittance (d) transconductance
- A nucleus of mass number 220 decays by α decay. The energy released in the reaction is 5 MeV. The kinetic energy of an α -particle is
 (a) $\frac{1}{54}$ MeV (b) $\frac{27}{11}$ MeV
 (c) $\frac{54}{11}$ MeV (d) $\frac{55}{54}$ MeV

- Four charges are arranged at the corners of a square as shown in the figure. The direction of electric field at the centre of the square is along

- (a) DC (b) BC
 (c) AB (d) AD
- The wavelengths of K_α X-rays for lead isotopes Pb^{208} , Pb^{206} and Pb^{204} are λ_1 , λ_2 and λ_3 respectively. Then
 (a) $\lambda_2 = \sqrt{\lambda_1 \lambda_3}$ (b) $\lambda_2 = \lambda_1 + \lambda_3$
 (c) $\lambda_2 = \lambda_1 \lambda_3$ (d) $\lambda_2 = \frac{\lambda_1}{\lambda_3}$
- A force F acting on an object varies with distance x as shown in the figure. The force is in N and x in m. The work done by the force in moving the object from $x = 0$ to $x = 6$ m is

- (a) 13.5 J (b) 10 J
 (c) 15 J (d) 20 J
- Which of the following graph depicts spring constant k versus length l of the spring correctly?

12. A body of mass 5 kg moving with a speed of 1.5 m/s on a horizontal smooth surface collides with a nearly weightless spring of force constant $k = 5 \text{ N/m}$. The maximum compression of the spring would be

- (a) 0.5 m (b) 0.15 m
(c) 1.5 m (d) 0.12 m
13. A body is moved along a straight line by a machine delivering constant power. The distance travelled by the body in time t is proportional to
- (a) $t^{1/2}$ (b) t
(c) $t^{3/2}$ (d) t^2
14. Light with an energy flux of 18 W/cm^2 falls on a non-reflecting surface at normal incidence. The pressure exerted on the surface is
- (a) 2 N/m^2 (b) $2 \times 10^{-4} \text{ N/m}^2$
(c) 6 N/m^2 (d) $6 \times 10^{-4} \text{ N/m}^2$
15. The dimensional formula of Planck's constant is
- (a) $[ML^2T^{-1}]$ (b) $[ML^2T^{-2}]$
(c) $[ML^0T^2]$ (d) $[MLT^2]$
16. A body is projected horizontally with a velocity of $4\sqrt{2} \text{ m/sec}$. The velocity of the body after 0.7 seconds will be nearly (Take $g = 10 \text{ m/sec}^2$)
- (a) 10 m/sec (b) 9 m/sec
(c) 19 m/sec (d) 11 m/sec
17. Three equal weights of 3 kg each are hanging on a string passing over a frictionless pulley as shown in figure. The tension in the string between masses II and III will be (Take $g = 10 \text{ m/sec}^2$)

- (a) 5 N (b) 6 N
(c) 10 N (d) 20 N
18. A ball is bouncing down a flight of stairs. The coefficient of restitution is e . The height of each step is d and the ball descends one step each bounce. After each bounce it rebounds to a height h above the next lower step. The height is large enough compared with the width of step so that the impacts are effectively head-on. Find

the relationship between h and d .

- (a) $h = \frac{d}{1-e^2}$ (b) $h = \frac{d}{1+e^2}$
(c) $h = \frac{d}{1+e}$ (d) $h = \sqrt{\frac{d}{1-e^2}}$

19. A conducting sphere of radius R carrying charge Q lies inside an uncharged conducting shell of radius $2R$. If they are joined by a metal wire, the amount of heat that will be produced is

- (a) $\frac{1}{4\pi\epsilon_0} \cdot \frac{Q^2}{4R}$ (b) $\frac{1}{4\pi\epsilon_0} \cdot \frac{Q^2}{2R}$
(c) $\frac{1}{4\pi\epsilon_0} \cdot \frac{Q^2}{R}$ (d) $\frac{2}{4\pi\epsilon_0} \cdot \frac{Q^2}{3R}$

20. Black holes in orbit around a normal star are detected from the earth due to the frictional heating of infalling gas into the black hole, which can reach temperatures greater than 10^6 K . Assuming that the infalling gas can be modelled as a blackbody radiator, then the wavelength of maximum power lies
- (a) in the visible region
(b) in the X-ray region
(c) in the microwave region
(d) in the gamma-ray region of electromagnetic spectrum

21. Neglecting the density of air, the terminal velocity obtained by a raindrop of radius 0.3 mm falling through air of viscosity $1.8 \times 10^{-5} \text{ N s m}^{-2}$ will be
- (a) 10.9 m s^{-1} (b) 7.48 m s^{-1}
(c) 3.7 m s^{-1} (d) 12.8 m s^{-1}

22. A particle executes simple harmonic motion of period T and amplitude l along a rod AB of length $2l$. The rod AB itself executes simple harmonic motion of the same period and amplitude in a direction perpendicular to its length. Initially, both the particle and the rod are in their mean positions. The path traced out by the particle will be

- (a) a circle of radius l
(b) a straight line inclined at $\frac{\pi}{4}$ to the rod
(c) an ellipse

(d) a figure of eight

23. What is the energy stored in the capacitor between terminals a and b of the network shown in the figure? (Capacitance of each capacitance $C = 1 \mu\text{F}$)

- (a) $12.5 \mu\text{J}$ (b) Zero
(c) $25 \mu\text{J}$ (d) $50 \mu\text{J}$
24. When a current is passed in a conductor, 3°C rise in temperature is observed. If the strength of current is made thrice, then rise in temperature will approximately be
(a) 36°C (b) 27°C
(c) 18°C (d) 9°C
25. In a metal with positive Thomson coefficient, current is passed from the lower temperature to higher temperature side. Then heat will be
(a) absorbed (b) constant
(c) evolved (d) either 'b' or 'c'
26. A moving coil galvanometer has a resistance of 900Ω . In order to send only 10% of the main current through this galvanometer, the resistance of the required shunt is
(a) 0.9Ω (b) 100Ω
(c) 405Ω (d) 90Ω
27. A current I_1 carrying wire AB is placed near another long wire CD carrying current I_2 . If wire AB is free to move, it will have

- (a) rotational motion only
(b) translational motion only
(c) rotational as well as translational motion
(d) neither rotational nor translational motion
28. A coil of wire of a certain radius has 100 turns and a self inductance of 15 mH . The self inductance of a second similar coil of 500 turns will be
(a) 75 mH (b) 375 mH
(c) 15 mH (d) none of these
29. In a series LCR circuit, the voltage across the

resistance, capacitance and inductance is 10 V each. If the capacitance is short circuited the voltage across the inductance will be

- (a) 10 V (b) $10\sqrt{2} \text{ V}$
(c) $10/\sqrt{2} \text{ V}$ (d) 20 V
30. If v_γ , v_x and v_m are the speeds of gamma rays, X-rays and microwaves respectively in vacuum, then.
(a) $v_\gamma > v_x > v_m$ (b) $v_\gamma < v_x < v_m$
(c) $v_\gamma > v_x > v_m$ (d) $v_\gamma = v_x = v_m$
31. Which out of following, cannot produce two coherent sources?
(a) Lloyd's mirror (b) Fresnel biprism
(c) Young's double slit (d) Prism
32. In Young's double slit experiment, the two slits act as coherent sources of equal amplitude a and of wavelength λ . In another experiment with the same set up, the two slits are sources of equal amplitude a and wavelength λ , but are incoherent. The ratio of intensities of light at the mid point of the screen in the first case to that in the second case is
(a) $2 : 1$ (b) $1 : 2$
(c) $3 : 4$ (d) $4 : 3$
33. If the kinetic energy of a particle is increased by 16 times, the percentage change in the de Broglie wavelength of the particle is
(a) 25% (b) 75%
(c) 60% (d) 50%
34. If the half lives of a radioactive element for α and β decay are 4 years and 12 years respectively, the ratio of its initial activity and that after 12 years will be
(a) 6.25% (b) 12.5%
(c) 25% (d) 50%
35. In the given circuit, the potential difference between A and B is

- (a) 0 (b) 5 volt
(c) 10 volt (d) 15 volt.
36. A ball is suspended by a thread of length L at the point O on a wall which is inclined to the vertical by α . The thread with the ball is displaced

by a small angle β away from the vertical and also away from the wall. If the ball is released, the period of oscillation of the pendulum when $\beta > \alpha$ will be

- (a) $\sqrt{\frac{L}{g}} \left[\pi + 2\sin^{-1} \frac{\alpha}{\beta} \right]$ (b) $\sqrt{\frac{L}{g}} \left[\pi - 2\sin^{-1} \frac{\beta}{\alpha} \right]$
 (c) $\sqrt{\frac{L}{g}} \left[2\sin^{-1} \frac{\beta}{\alpha} - \pi \right]$ (d) $\sqrt{\frac{L}{g}} \left[2\sin^{-1} \frac{\alpha}{\beta} + \pi \right]$

37. A radioactive nucleus is being produced at a constant rate α per second. Its decay constant is λ . If N_0 are the number of nuclei at time $t = 0$, then the maximum number of nuclei possible are

- (a) $N_0 + \frac{\alpha}{\lambda}$ (b) N_0
 (c) $\frac{\lambda}{\alpha} + N_0$ (d) $\frac{\alpha}{\lambda}$

38. A wire of length l and mass m is bent in the form of a semicircle. The gravitational field intensity at the centre of semicircle is

- (a) $\frac{Gm}{\pi l}$ along x-axis
 (b) $\frac{Gm}{\pi l}$ along y-axis
 (c) $\frac{2\pi Gm}{l^2}$ along y-axis
 (d) $\frac{2\pi Gm}{l^2}$ along x-axis
39. In a concave mirror, an object is placed at a distance d_1 from the focus and the image is formed at a distance d_2 from the focus. Then the focal length of the mirror is
- (a) $\sqrt{d_1 d_2}$ (b) $d_1 d_2$
 (c) $(d_1 + d_2)/2$ (d) $\sqrt{d_1 / d_2}$
40. A short linear object, of length l , lies along the axis of a concave mirror, of focal length f , at a distance d from the pole of the mirror. The size of the image is then (nearly)
- (a) $\frac{lf}{d-f}$ (b) $\frac{d-f}{lf}$

(c) $l \frac{f^2}{(d-f)^2}$ (d) $\frac{(d-f)^2}{f^2} l$

Directions : In the following questions (41-60), a statement of assertion (A) is followed by a statement of reason (R). Mark the correct choice as :

- (a) If both assertion and reason are true and reason is the correct explanation of assertion
 (b) If both assertion and reason are true but reason is not the correct explanation of assertion
 (c) If assertion is true but reason is false
 (d) If both assertion and reason are false.

41. Assertion : Liquid molecules have greater potential energy at the melting point.

Reason : Intermolecular spacing between molecules increases at melting point.

42. Assertion : The bob of a simple pendulum is a ball full of water, if a fine hole is made in the bottom of the ball, the time period first increases and then decreases.

Reason : As water flows out of the bob the weight of bob decreases.

43. Assertion : Electric potential of earth is taken zero.

Reason : No electric field exists on earth surface.

44. Assertion : A charge, whether stationary or in motion produces a magnetic field around it.

Reason : Moving charges produce only electric field in the surrounding space.

45. Assertion : Magnetic susceptibility is a pure number.

Reason : The value of magnetic susceptibility for vacuum is one.

46. Assertion : Transformers are used only in alternating current source not in direct current.

Reason : Only a.c. can be stepped up or down by means of transformers.

47. Assertion : A total reflecting prism is used to erect the inverted image without deviation.

- Reason** : Rays of light incident parallel to base of prism emerge out as parallel rays.
48. **Assertion** : The edges of the images of white object formed by a concave mirror on the screen appear white.
Reason : Concave mirror does not suffer chromatic aberration.
49. **Assertion** : A photon has no rest mass, yet it carries definite momentum.
Reason : Momentum of photon is due to its energy and hence its equivalent mass.
50. **Assertion** : A photocell is called an electric eye.
Reason : When light is incident on some semiconductor its electrical resistance is reduced.
51. **Assertion** : Nuclei having number about 60 are most stable.
Reason : When two or more light nuclei are combined into a heavier nucleus, then the binding energy per nucleon will increase.
52. **Assertion** : In a common-emitter amplifier, the load resistance of the output circuit is 1000 times the load resistance of the input circuit. If $\alpha = 0.98$, then voltage gain is 49×10^3 .
Reason : $\alpha = \frac{\beta}{1-\beta}$ (symbols have their usual meaning).
53. **Assertion** : Most amplifiers use common emitter circuit configuration.
Reason : Its input resistance is comparatively higher.
54. **Assertion** : For an isothermal process in an ideal gas, the heat absorbed by the gas is entirely used in the work done by the gas.
Reason : During a process taking place in a system, the temperature remains constant then the process is isothermal.
55. **Assertion** : When hot water is poured in a beaker of thick glass, the beaker cracks.
Reason : Outer surface of the beaker expands suddenly.
56. **Assertion** : Generally the path of a projectile from the earth is parabolic but it is elliptical for projectiles going to a very great height.
Reason : Up to ordinary height the projectile moves under a uniform gravitational force, but for great heights, projectile moves under a variable force.
57. **Assertion** : Angular speed of a planet around the sun increases, when it is closer to the sun.
Reason : Total angular momentum of the system remains constant.
58. **Assertion** : The size and shape of the rigid body remains unaffected under the effect of external forces.
Reason : The distance between two particles remains constant in a rigid body.
59. **Assertion** : Impulsive force is large and acts for a short time.
Reason : Finite change in momentum should be produced by the force.
60. **Assertion** : The dimensional formula for product of resistance and conductance is same as for dielectric constant.
Reason : Both have dimensions of time constant.

CHEMISTRY

61. KF combines with HF to form KHF_2 . This compound contains the species
 (a) K^+ , F^- and H^+ (b) K^+ , F^- and HF
 (c) K^+ and $[\text{HF}_2]^-$ (d) $[\text{KHF}]^+$ and F_2
62. For a dilute solution, Raoult's law states that
 (a) The relative lowering of vapour pressure is proportional to the amount of solute in solution
 (b) The relative lowering of vapour pressure is equal to the mole fraction of solute
 (c) The lowering of vapour pressure is equal to the mole fraction of the solute
 (d) The vapour pressure of the solution is equal to the mole fraction of the solvent.
63. To a 25 ml H_2O_2 solution, excess of acidified solution of KI was added. The iodine liberated required 20 ml of 0.3 N $\text{Na}_2\text{S}_2\text{O}_3$ solution.

The volume strength of H_2O_2 solution is

- (a) 1.344 g/L (b) 3.244 g/L
(c) 5.4 g/L (d) 4.08 g/L

64. Which of the following shows bond in silicone?

- (a) Si-C-Si-C-Si (b) Si-Si-Si-Si
(c) -Si-O-Si-O-Si- (d) Si-C-Si-O-Si.

65. pH of a 0.01 M solution ($K_a = 6.6 \times 10^{-4}$)

- (a) 7.6 (b) 8
(c) 2.6 (d) 5

66. In a homogenous reaction $A \longrightarrow B + C + D$ the initial pressure was P_0 and after time t it was P . Expression for rate constant k in terms of P_0 , P and t will be

(a) $k = \frac{2.303}{t} \log \frac{2P_0}{3P_0 - P}$

(b) $k = \frac{2.303}{t} \log \frac{2P_0}{P_0 - P}$

(c) $k = \frac{2.303}{t} \log \frac{3P_0 - P}{2P_0}$

(d) $k = \frac{2.303}{t} \log \frac{2P_0}{3P_0 - 2P}$

67. Which curve corresponds to the temperature dependance of the rate R of a simple one step reaction?

68. A vessel of one litre capacity containing 1 mole of SO_3 is heated till a state of equilibrium is attained.

At equilibrium, 0.6 moles of SO_2 had formed.

The value of equilibrium constant is

- (a) 0.18 (b) 0.36
(c) 0.45 (d) 0.68.

69. A 0.1 molal solution of an acid is 4.5% ionized. Calculate freezing point. (molecular weight of the acid is 300). $K_f = 1.86 \text{ K mol}^{-1} \text{ kg}$.

- (a) -0.199°C (b) 2.00°C
(c) 0°C (d) -0.269°C

70. Which of the following is an example of chain silicates?

- (a) Kaolinite (b) Zircon
(c) Benitonite (d) Diopside

71. Which of the element shows +4 oxidation state?

- (a) Sn (b) Ra
(d) Fr (d) Sc

72. Tincture of iodine is

- (a) aqueous solution of I_2
(b) solution of I_2 in aqueous KI
(c) alcoholic solution of I_2
(d) aqueous solution of KI.

73. The specific conductance of a N/10 KCl at 25°C is $0.0112 \text{ ohm}^{-1} \text{ cm}^{-1}$. The resistance of cell containing solution at the same temperature was found to be 55 ohm. The cell constant will be

- (a) 6.16 cm^{-1} (b) 0.616 cm^{-1}
(c) 0.0616 cm^{-1} (d) 616 cm^{-1}

74. Decreasing order of stability of ions is

- (i) $\text{CH}_3 - \overset{+}{\text{C}}\text{H} - \text{CH}_3$
(ii) $\text{CH}_3 - \overset{+}{\text{C}}\text{H} - \text{OCH}_3$
(iii) $\text{CH}_3 - \overset{+}{\text{C}}\text{H} - \text{COCH}_3$
(a) (i) > (ii) > (iii) (b) (ii) > (i) > (iii)
(c) (ii) > (iii) > (i) (d) (iii) > (i) > (ii)

76. $\text{H}_3\text{C} - \text{CH} - \text{CH}_3$

What is B?

What is D?

78. Mercurous chloride exists in the form of

- (a) Hg^+ (b) Hg_2^{2+}
 (c) Hg^{2+} (d) Hg_3^{2+}

79. Formula of microcosmic salt is

- (a) Na_2HPO_4 (b) $\text{Na}(\text{NH}_4)\text{HPO}_4$
 (c) K_2HPO_4 (d) $\text{Na}_2\text{PO}_4 \cdot \text{K}_2\text{PO}_4$

80. What is the molarity of H_2SO_4 solution that has a density of 1.84 g/cc at 35°C and contains 98% by weight?

- (a) 4.18 M (b) 8.14 M
 (c) 18.4 M (d) 18 M.

81. A mixture of two miscible liquids A and B is distilled under equilibrium conditions at 1 atm pressure. The mole fraction of A in solution and vapour phase are 0.30 and 0.60 respectively. Assuming ideal behaviour of the solution and the vapour, calculate the ratio of the vapour pressure of pure A to that of pure B.

- (a) 4.0 (b) 3.5
 (c) 2.5 (d) 1.85

82. The variation of volume V , with temperature T , keeping pressure constant is called the coefficient

of thermal expansion (α) of a gas, i.e., $\alpha = \frac{1}{V} \left(\frac{\partial V}{\partial T} \right)_P$. For an ideal gas α is equal to

- (a) T (b) $1/T$
 (c) P (d) $1/P$

83. The molecules having the same hybridization, shape and number of lone pairs of electrons are

- (a) SeF_4 , XeO_2F_2 (b) SF_4 , XeF_2
 (c) XeOF_4 , TeF_4 (d) SeCl_4 , XeF_4

84. The correct order of stability of the superoxides is

- (a) $\text{KO}_2 > \text{RbO}_2 > \text{CsO}_2$
 (b) $\text{KO}_2 > \text{CsO}_2 > \text{RbO}_2$
 (c) $\text{CsO}_2 > \text{RbO}_2 > \text{KO}_2$
 (d) $\text{RbO}_2 > \text{CsO}_2 > \text{KO}_2$

85. Schottky defect in crystals is observed when

- (a) unequal number cations and anions are missing from the lattice
 (b) equal number of cations and anions are missing from the lattice
 (c) an ion leaves its normal site and occupies an interstitial site
 (d) density of the crystal is increased

86. Consider the reaction

The correct explanation is

- (a) The product is formed due to nucleophilic substitution
 (b) The product is formed according to Saytzeff's rule
 (c) Conjugated double bond product is formed due to higher stability because of resonance stabilization
 (d) $(\text{CH}_3)_3\text{CO}^-$ is a better leaving group

87. 2.5 g of the carbonate of a metal was treated with 100 ml of 1N H_2SO_4 . After the completion of the reaction, the solution was boiled off to expel CO_2 and was then titrated against 1N NaOH solution. The volume of alkali that would be consumed, if the equivalent weight of the metal is 20

- (a) 50 (b) 25
 (c) 75 (d) 100.

88. In solvents like DMSO, acetonitrile, F^- ion of dissolved NaF is more reactive than in methyl alcohol. Explain

- (a) CH_3OH is more polar than DMSO and CH_3CN
 (b) CH_3OH is less polar than DMSO and CH_3CN
 (c) unsolvated F^- ion is DMSO or CH_3CN acts more efficiently as nucleophile
 (d) $-\text{OH}$ group is a better leaving group than F^- ion
89. Which of the following fluorides has the lowest melting point?
 (a) BaF_2 (b) SrF_2
 (c) CaF_2 (d) BeF_2
90. Which of the following has the highest tendency to give the reaction,

$$\text{M}^+(\text{g}) \xrightarrow[\text{medium}]{\text{aqueous}} \text{M}^+(\text{aq})$$

 (a) Na (b) Li
 (c) K (d) Rb
91. How many geometrical isomers are possible in the following two alkenes?
 (i) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH} = \text{CH} - \text{CH}_3$
 (ii) $\text{CH}_3 - \text{CH} = \text{CH} - \text{CH} = \text{CH} - \text{Cl}$
 (a) 4 and 4 (b) 4 and 3
 (c) 3 and 3 (d) 3 and 4.
92. The equilibrium constant for mutarotation $\alpha\text{-D Glucose} \rightleftharpoons \beta\text{-D Glucose}$ 1.8. What percentage of α form remains at equilibrium?
 (a) 35.7 (b) 64.3
 (c) 55.6 (d) 44.4
93. 2-phenylethylbromide when heated with NaOEt , elimination takes place. No deuterium exchange takes place when the reaction is carried out in $\text{C}_2\text{H}_5\text{OD}$ solvent. The mechanism will be
 (a) E1 elimination (b) E2 elimination
 (c) E1cB elimination (d) E2 or E1cB
94. The $\text{M} - \text{O} - \text{M}$ bond angles in M_2O (where M is halogen) is in the order
 (a) $\text{Br}_2\text{O} > \text{Cl}_2\text{O} > \text{F}_2\text{O}$
 (b) $\text{F}_2\text{O} > \text{Br}_2\text{O} > \text{Cl}_2\text{O}$
 (c) $\text{F}_2\text{O} > \text{Cl}_2\text{O} > \text{Br}_2\text{O}$
 (d) $\text{Cl}_2\text{O} > \text{F}_2\text{O} > \text{Br}_2\text{O}$
95. Hydrofluoric acid is a weak acid. At 25°C , the molar conductivity of 0.002 M HF is $176.2 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}$. If its $\Lambda_m^\circ = 405.2 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}$. Equilibrium constant at the given concentration is
 (a) $6.7 \times 10^{-4} \text{ M}$ (b) $3.2 \times 10^{-4} \text{ M}$
 (c) $6.7 \times 10^{-5} \text{ M}$ (d) $3.2 \times 10^{-5} \text{ M}$
96. In Oppenauer's oxidation,
 (a) secondary alcohol is oxidised to carboxylic

- acid in acetone solvent using aluminium tertiary butoxide
 (b) secondary alcohol is oxidised to carboxylic acid without affecting the $\text{C} = \text{C}$ or $\text{C} \equiv \text{C}$ bond by aluminium tertiary butoxide in acetone solvent
 (c) secondary alcohol is oxidised to ketone without affecting $\text{C} = \text{C}$ or $\text{C} \equiv \text{C}$ bond by aluminium tertiary butoxide
 (d) secondary alcohol is oxidised to ketone by chromic acid - pyridine complex.
97. Incorrect statement about Ge is
 (a) GeO_2 is weakly acidic
 (b) $\text{Ge}(\text{OH})_2$ is amphoteric
 (c) GeCl_2 is more stable than GeCl_4
 (d) Ge-Ge bond energy is lesser than that of Si-Si

98. In an isobaric process, when temperature changes from T_1 to T_2 , ΔS is equal to
 (a) $2.303 C_p \log (T_2/T_1)$ (b) $2.303 C_p \ln (T_2/T_1)$
 (c) $C_p \ln (T_1/T_2)$ (d) $C_v \ln (T_2/T_1)$

99. In one reaction,

-Mg-Br is treated with CH_3CN and then hydrolysed. In another reaction

-Mg-Br is treated with ethyl acetate and then hydrolysed.

A and B are

- (a) -CHO and -CO-CH₃
 (b) -CO-CH₃ and -CO-CH₃
 (c) -CO-CH₃ and -CO-OC₂H₅
 (d) -CO-CH₃ and

100. In the following sequence of the reactions, identify the final product.

- (a)  (b) 
- (c)  (d) 

Directions : In the following questions (101-120), a statement of assertion (A) is followed by a statement of reason (R). Mark the correct choice as :

- (a) If both assertion and reason are true and reason is the correct explanation of assertion
 (b) If both assertion and reason are true but reason is not the correct explanation of assertion
 (c) If assertion is true but reason is false
 (d) If both assertion and reason are false.

101. Assertion : Electromeric effect is brought into play only at the requirement of the reagent.

Reason : It is a temporary effect in which bond pair is shifted to one of the constituent atoms.

102. Assertion : In fused state, calcium chloride cannot be used to dry alcohol or NH_3 .

Reason : CaCl_2 is not a good desiccant.

103. Assertion : Heat of neutralisation of nitric acid with NaOH is same to that of HCl and NaOH .

Reason : In both cases strong acid and strong bases are neutralised.

104. Assertion : *Cis*-2-butene gives *meso*-2,

3-butanediol with dilute alkaline KMnO_4 solution.

Reason : Dilute alkaline KMnO_4 solution gives *trans* addition with alkenes.

105. Assertion : Ethers can be dried by using sodium wire.

Reason : Ethers do not react with sodium.

106. Assertion : In rate law, unlike in the expression for equilibrium constants, the exponents for concentrations do not necessarily match the stoichiometric coefficients.

Reason : It is the mechanism and not the balanced chemical equation for the overall change that governs the reaction rate.

107. Assertion : The presence of Ag^+ enhances the solubility of alkenes in water.

Reason : Alkenes are weakly polar in nature.

108. Assertion : A reaction which is spontaneous and accompanied by decrease of randomness must be exothermic.

Reason : All exothermic reactions are accompanied by decrease of randomness.

109. Assertion : Compressibility factor for hydrogen varies with pressure with positive slope at all pressure.

Reason : Even at low pressure, repulsive forces dominate for hydrogen gas

110. Assertion : *p*-N,N-dimethylaminobenzaldehyde undergoes benzoin condensation.

Reason : The aldehydic ($-\text{CHO}$) group is meta directing.

111. Assertion : The S-S-S bond angle in S_8 molecule is 105° .

Reason : S_8 has a V-shape.

112. Assertion : Sodium formate has both the C-O bonds have same value $1.27 \text{ \AA}$.

Reason : Equal bond length is due to the phenomenon of resonance.

113. Assertion : $\text{C}_2\text{H}_5\text{Br}$ reacts with alcoholic solution of AgNO_2 to form nitroethane as the major product.

Reason : NO_2^- is an ambident ion.

114. Assertion : Ice $\rightleftharpoons$ water, if pressure is applied water will evaporate.

Reason : Increases of pressure pushes the equilibrium towards the side in which number of gaseous molecule increases.

115. Assertion : Ebonite is highly vulcanised rubber.

Reason : Perlon is used in the manufacture of fibres.

116. Assertion : Al forms $[AlF_6]^{3-}$ but B does not form $[BF_6]^{3-}$.

Reason : B does not react with fluorine.

117. Assertion : Esters which contain α -hydrogens undergo Claisen condensation.

Reason : $LiAlH_4$ reduction of esters gives acids.

118. Assertion : In an acid-base titration involving strong base and a weak acid, methyl orange can be used as an indicator.

Reason : Methyl orange changes its colour in pH range of 7 to 9.

119. Assertion : Millon's test is a test for identification of proteins.

Reason : Millon's reagent is a solution of mercurous nitrate and mercuric nitrate in nitric acid containing little nitrous acid.

120. Assertion : $Cu(OH)_2$ is soluble in NH_4OH but not in $NaOH$.

Reason : $Cu(OH)_2$ forms a soluble complex with NH_3 .

BIOLOGY

121. What is diapedesis?

- (a) a kind of amoeboid movement
- (b) the process of filtration of urea in kidney
- (c) a type of locomotion found in *Hydra*
- (d) migration of WBCs into the tissue spaces from blood capillaries

122. Which one of the following depresses brain activity and produces feelings of calmness, relaxation and drowsiness?

- (a) morphine
- (b) valium
- (c) amphetamines
- (d) hashish.

123. Which of the following nerves arises from organ of Corti?

- (a) olfactory nerve
- (b) cochlear nerve

- (c) abducens nerve
- (d) none of these

124. Delicate hair-like feathers which remain sparsely distributed over the body are

- (a) coverts
- (b) filoplumes
- (c) plumules
- (d) remiges

125. *Homo erectus* evolved during

- (a) pleistocene
- (b) miocene
- (c) pliocene
- (d) holocene

126. Which of the following postulates is related with Neo-Darwinism?

- (a) mutations are believed to help form new species
- (b) it incorporates isolation as an essential component of evolution
- (c) it can explain the occurrence of unchanged forms over millions of years
- (d) all of the above

127. Intermediate host is absent in the infection of

- (a) *Plasmodium*
- (b) *Trypanosoma*
- (c) *Entamoeba*
- (d) filarial worm.

128. Which one feature is common to leech, cockroach and scorpion?

- (a) nephridia
- (b) ventral nerve cord
- (c) cephalization
- (d) antennae.

129. The type of epithelial cells which line the inner surface of Fallopian tubes, bronchioles and small bronchi are known as

- (a) squamous epithelium
- (b) columnar epithelium
- (c) ciliated epithelium
- (d) cuboidal epithelium

130. A person who shows unpredictable moods, outbursts of emotions, quarrelsome behaviour and conflicts with others is suffering from

- (a) borderline personality disorder (BPD)
- (b) mood disorder
- (c) addictive disorder
- (d) schizophrenia

131. In humans at the end of first meiotic division, the male germ cells differentiate into the

- (a) primary spermatocytes
- (b) secondary spermatocytes
- (c) spermatids
- (d) spermatogonia

132. Contraceptive oral pills help in birth control by

- (a) killing the sperms in uterus

- (b) preventing implantation
(c) preventing ovulation
(d) both (b) and (c).
133. Which one of the following is a sesamoid bone?
(a) pelvis (b) patella
(c) pterygoid (d) pectoral girdle.
134. Respiration is controlled by
(a) medulla oblongata
(b) cerebellum
(c) hypothalamus (d) cerebrum
135. Duodenum has characteristic Brunner's gland which secretes two hormones called
(a) prolactin, parathormone
(b) secretin, cholecystokinin
(c) enterocrinin, duocrinin
(d) gastrin, euterogastrone.
136. Which of the following species has the chromosome complement similar to that of *Triticum aestivum*?
(a) *Zea mays*
(b) *Secale cereale*
(c) *Gossypium*
(d) *Aegilops*
137. Eugenics is the branch concerned with
(a) improving the quality of human race by symptomatic treatment of genetic diseases
(b) improving the quality of human populations by the application of genetic principles
(c) improving the quality of human race by providing best suitable environment
(d) none of the above.
138. What is incorrect about the following figure representing DNA replication?
- 
- (a) the direction of DNA replication in strand (i)
(b) the direction of DNA replication in strand (ii)
(c) discontinuous replication of strand (i)
(d) discontinuous replication of strand (ii)
139. Which of the following is the characteristic of PS-I.
(a) it is active only upto 680 nm of light
(b) the reaction centre of PS-I is P_{680}
(c) PS-I is reduced by the electrons released in photolysis of water
(d) PS-I is involved in non-cyclic photophosphorylation.
140. Bark refers to
(a) phellem + phellogen + phelloderm
(b) periderm + cortex
(c) phellem + phelloderm + secondary phloem
(d) periderm + cortex + pericycle + secondary phloem
141. Cotton fibres mainly contains
(a) cellulose (b) glycogen
(c) protein (d) lipid
142. The outermost limiting layer of mycoplasma is made up of
(a) cell wall (b) cell membrane
(c) mucilaginous sheath
(d) slime layer
143. Which of the following statements about *Spirogyra* is correct?
(a) lateral conjugation takes place in homothallic species
(b) scalariform conjugation takes place in homothallic species
(c) lateral conjugation takes place in heterothallic species
(d) the type of conjugation is unrelated to homothallic & heterothallic species
144. Which of the following sugars is not found in plants?
(a) sucrose (b) glucose
(c) lactose (d) fructose
145. The binding site of tRNA with mRNA & amino acids respectively are
(a) mRNA with DHU loop & amino acid with CCA end
(b) mRNA with CCA end & amino acid with anticodon loop
(c) mRNA with anticodon loop & amino acid with DHU loop
(d) mRNA with anticodon loop & amino acid with CCA end
146. Percentage of recombination between A and B is 9%, A and C is 17%, B and C is 26%, then the arrangement of genes is
(a) ABC (b) ACB
(c) BCA (d) BAC

147. Which of the following is true?
 (a) umbel is a racemose inflorescence where all stalked flower aggregate on the flat receptacle
 (b) raceme is a racemose inflorescence having main axis shortened & flower born acropetally
 (c) spadix is a racemose inflorescence having pendulous spike with main axis much flattened
 (d) spike is a racemose inflorescence having sessile flowers
148. Jute fibres deteriorate quickly because
 (a) cellulose content is high
 (b) lignin content is high
 (c) cellulose content is low
 (d) lignin content is low
149. The branched sclereids present in hydrophytes are
 (a) osteosclereids (b) trichosclereids
 (c) macrosclereids (d) astrosclereids.
150. The enzyme decarboxylase catalyses the following step
 (a) conversion of citric acid to *cis* aconitic acid
 (b) fumaric acid to malic acid
 (c) oxalosuccinic acid to α -ketoglutaric acid
 (d) malic acid to oxaloacetic acid
151. Which of the following is true regarding the given electron transport chain?
 $\text{CoQ} \rightarrow \text{Cyt } c \rightarrow \text{Cyt } aa_3 \rightarrow \text{O}_2$
 (a) $\text{CoQ} \rightarrow \text{Cyt } c$ is H^+ absorbing site
 (b) $aa_3 \rightarrow \text{O}_2$ H^+ yielding site
 (c) $\text{CoQ} \rightarrow \text{Cyt } c$ is H^+ yielding site and $aa_3 \rightarrow \text{O}_2$ is H^+ absorbing site
 (d) no H^+ is absorbed or released
152. Which one of the following is not a microelement for plants?
 (a) Cu (b) B
 (c) Zn (d) Cr
153. National bird of India is
 (a) *Psittacula* (b) *Passer domesticus*
 (c) *Pavo cristatus* (d) *Parakeet*.
154. Rain is called acid-rain when its pH is below
 (a) 7 (b) 6.5
 (c) 6 (d) 5.6
155. Cytokines that provide non specific immunity against virus are
 (a) interleukin (b) tumour necrosis
- (c) colony stimulating
 (d) interferon.
156. By all of the following ways bacteria become resistant to antibiotic except
 (a) making enzymes that inactivate the drug
 (b) becoming impermeable to the drug
 (c) modifying the target of the drug
 (d) moving away from the drug.
157. Specific proteins responsible for the flow of materials and information into the cell are called
 (a) membrane receptors
 (b) carrier proteins
 (c) integral proteins (d) none of these
158. Which of the following conditions represents a case of co-dominant genes?
 (a) a gene expresses itself, suppressing the phenotypic effect of its alleles
 (b) genes that are similar in phenotypic effect when present separately, but when together interact to produce a different trait
 (c) alleles, both of which interact to produce a trait, which may or may not resemble either of the parental types
 (d) alleles, each of which produces an independent effect in a heterozygous condition
159. The first bioherbicide developed in 1981 was based on
 (a) *Phytophthora palmivora*
 (b) *Phytophthora infestans*
 (c) *Bacillus thuringiensis*
 (d) *Azadirachta indica*
160. Upon fertilization, what structure develops from carpel?
 (a) testa (b) tegmen
 (c) pericarp (d) perisperm
- Directions : In the following questions (161-180), a statement of assertion (A) is followed by a statement of reason (R). Mark the correct choice as :**
 (a) If both assertion and reason are true and reason is the correct explanation of assertion
 (b) If both assertion and reason are true but reason is not the correct explanation of assertion
 (c) If assertion is true but reason is false
 (d) If both assertion and reason are false.
161. Assertion : Secondary succession takes place in recently denuded area.
 Reason : It is caused due to baring of an area.

162. **Assertion** : Connective tissue inside the brain is essential for conduction of nerve impulse.
Reason : Connective tissue hold together the nerve cells of brain.
163. **Assertion** : Mammary glands are apocrine glands.
Reason : The distal part containing secretory granules break down and leaves as a secretion.
164. **Assertion** : Cytokinins increases shelf life of fruits and vegetables.
Reason : Cytokinins induce cell division.
165. **Assertion** : Angina pectoris means "pain in the chest".
Reason : It results due to carrying of extra blood to the heart muscle.
166. **Assertion** : Protandry and protogyny ensures cross fertilization.
Reason : Cross fertilization introduces variation in progeny.
167. **Assertion** : Bursa fabricii lies on the ventral side of the cloaca in birds.
Reason : Bursa fabricii is related with flight adaptation.
168. **Assertion** : Glycolysis is the first step of respiration in which glucose completely breaks into CO_2 and H_2O .
Reason : In this process, there is net gain of twenty four molecules of ATP.
169. **Assertion** : Restriction enzymes cut the strand of DNA to produce sticky ends.
Reason : Stickiness of the ends facilitates the action of the enzyme DNA polymerase.
170. **Assertion** : Excess of nitrates in drinking water are harmful for infants.
Reason : Nitrates are responsible for blue baby syndrome.
171. **Assertion** : Amniocentesis is a process of foetal sex determination.
Reason : Metabolic errors and other diseases can be diagnosed prenatally by this process.
172. **Assertion** : Pollen mother cells (PMCs) are the first male gametophytic cells.
Reason : Each PMC gives rise to two pollens.
173. **Assertion** : Nucleus is the controlling centre of a cell.
Reason : Pores in the nuclear envelope regulate the flow of materials in and out of the nucleus.
174. **Assertion** : Hormone calcitonin has antagonistic effect to that of parathormone.
Reason : Calcitonin decreases blood calcium level while parathormone increases blood calcium level.
175. **Assertion** : Dark reaction occurs only at night in the stroma of chloroplast.
Reason : CO_2 fixation occurs only during C_3 cycle.
176. **Assertion** : The primitive atmosphere was reducing one i.e. without oxygen.
Reason : In the primitive atmosphere, oxygen was involved in forming ozone layer.
177. **Assertion** : Jave Ape-man, Peking man and Heidelberg man are the fossils of *Homo erectus*.
Reason : *Homo erectus* evolved from *Homo habilis*.
178. **Assertion** : Loss of water produces a negative hydrostatic pressure.
Reason : Positive hydrostatic pressure is developed due to osmotic entry of water into it.
179. **Assertion** : Mammalian ova produces hyaluronidase.
Reason : The eggs of mammal are microlecithal and telolecithal.
180. **Assertion** : A gamete may carry either of the traits but not both.
Reason : This is Mendel's second law or law of independent assortment.

GENERAL KNOWLEDGE

181. A pendulum clock is set to give correct time at the sea level. The clock is moved to a hill station at an altitude h above sea level. In order to keep correct time on the hill station which one of the following adjustments is required?

(a) the length of the pendulum has to be reduced
 (b) the length of the pendulum has to be increased
 (c) the mass of the pendulum has to be increased
 (d) the mass of the pendulum has to be reduced.

182. Match List I with List II and select the correct answer using the codes given below the lists:

List I (Date)	List II (Events)
(A) 24th October	(1) Human Rights Day
(B) 10th December	(2) Common wealth Day
(C) 24th May	(3) United Nations Day
(D) 21st September	(4) International Day of Peace.

Codes :

A	B	C	D
(a) 4	1	2	3
(b) 3	1	2	4
(c) 3	2	1	4
(d) 4	2	1	3

183. The President of India is elected by
- (a) members of both Houses of Parliament
 (b) members of both Houses of Parliament and of State Legislatures
 (c) members of both Houses of Parliament and of State Legislative Assemblies
 (d) elected members of both Houses of Parliament and elected members of state Legislative Assemblies.

184. Who wrote the book 'India Wins Freedom'?

(a) Maulana Abul Kalam Azad
 (b) Mahatma Gandhi
 (c) Sir Mohammad Iqbal
 (d) Abdul Ghaffar Khan.

185. Consider the following statements about the National Anthem:

1. It was first sung on December 27, 1911 at the Calcutta session of the Indian National Congress.
 2. It was adopted by the Constituent Assembly

on January 26, 1950

3. Playing time of the full version of the National Anthem is approximately 52 seconds.

Which of the statements given above is/are correct?

(a) 1 only (b) 1 and 2
 (c) 1 and 3 (d) 2 and 3.

186. Match List I with List II and select the correct answer using the codes given below the lists.

List I (Vitamin)	List II (Function)
(A) Vitamin A	(1) Assists in normal reproductive function
(B) Vitamin C	(2) Assists in absorption and metabolism of calcium
(C) Vitamin D	(3) Essential for healthy skin and normal vision.
(D) Vitamin B ₁₂	(4) Essential for formation of collagen. (5) Essential for red blood cell formation.

Codes :

A	B	C	D
(a) 2	1	5	4
(b) 3	4	2	5
(c) 3	2	4	1
(d) 2	1	3	5.

187. The metal compound commonly found in Sindhoor or Kumkum is based on

(a) tin (b) lead
 (c) copper (d) zinc.

188. Which among the following thermometers is preferred for measuring temperature around 1250°C?

(a) mercury thermometer
 (b) constant volume gas thermometer
 (c) optical pyrometer
 (d) platinum resistance thermometer.

189. The term stagflation refers to a situation where

(a) growth has no relation with the change in prices
 (b) rate of growth and prices both are decreasing
 (c) rate of growth is faster than the rate of price increase
 (d) rate of growth is slower than the rate of price increase.

190. Which event brought about a profound change

in Ashoka's administrative policy?

- (a) the third Buddhist council
- (b) the Kalinga war
- (c) his embracing of buddhism
- (d) his sending of missionary to Ceylon.

191. The plant dye *Henna* imparts orange-red colour to skin and hair due to its reaction with which of the following?

- (a) proteins and amino acids
- (b) lipids
- (c) carbohydrates
- (d) nucleic acids.

192. Match the List I with List II and select the correct answer using the codes given below the lists.

List I (Islands)	List II (Ocean)
(A) Hawaiian Islands	(1) Indian Ocean
(B) Solomon Islands	(2) North Pacific Ocean
(C) St. Helena	(3) South Pacific Ocean
(D) Seychelles	(4) South Atlantic Ocean

Codes :

A	B	C	D
(a) 2	3	4	1
(b) 1	4	3	2
(c) 2	4	3	1
(d) 1	3	4	2

193. Delingha came recently in news? What is this?

- (a) it is an endangered species of an Indian bird
- (b) it is place in Europe which was struck by an earthquake
- (c) China recently deployed missiles in the Delingha near Tibet sending alarming signals across political establishment in India
- (d) none of the above.

194. Octopus is an anti-terror agency of

- (a) Kerala
- (b) Andhra Pradesh

- (c) Karnataka
- (d) Gujarat.

195. Indira Gandhi Prize for peace, disarmament and development has recently been conferred on

- (a) Bill Gates
- (b) Jacob Zuma
- (c) Asma Jahangir
- (d) none of the above.

196. India's Deep Joshi has recently been honoured with

- (a) Magsaysay Award
- (b) Whitely Prize
- (c) Right to Livelihood Award
- (d) none of these.

197. The runner up in 2009 Wimbledon Men's Singles was

- (a) Roger Federer
- (b) Rafael Nadal
- (c) Andy Roddick
- (d) none of the above.

198. Who amongst the following cricketers has been chosen for Rajiv Gandhi Khel Ratna Award, 2007?

- (a) Rahul Dravid
- (b) M.S. Dhoni
- (c) Sachin Tendulkar
- (d) Virender Sehwag.

199. Who amongst the following became the first woman pilot in the world to fly MIG-35 fighter plane?

- (a) Suman Sharma
- (b) Saudamini Deshmukh
- (c) Kirsty Moore
- (d) Nicole Malachowski.

200. Mr. Paul Krugman whose name was in news recently is a famous

- (a) medical scientist
- (b) economist
- (c) author
- (d) astrophysicist.

SOLUTIONS

PHYSICS

1. (a) : Focal length of a convex lens having power

$$2.5 \text{ D}, = \frac{1}{2.5} \text{ m}$$

Also focal length of a lens in a medium of refractive index μ is given by

$$\frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\Rightarrow 2.5 = \frac{1}{f} = \left(\frac{3}{2} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \quad \dots (i) \quad (\text{in air})$$

$$\Rightarrow \frac{1}{f'} = \left(\frac{3}{4} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \quad \dots (ii) \quad \left[\because \mu_s = \frac{3}{4} \right] \text{ in liquid}$$

$$\text{Dividing the two, } 2.5 f' = \frac{0.5}{-0.25}$$

$$\Rightarrow \frac{1}{f'} = \frac{-5}{25 \times 0.25} = -1.25 \text{ D}$$

2. (a) : Magnetic moment associated with electrons orbiting around the nucleus is given in terms of Bohr magneton (μ_B)

$$\mu_B = \frac{eh}{2m_e}$$

e = electronic charge, m_e = electronic mass.

In nuclear physics, magnetic moments associated with the spins of protons and neutrons are expressed in nuclear magnetons (μ_N)

$$\mu_N = \frac{eh}{2m_p}$$

m_p = mass of a proton.

$$\Rightarrow \frac{\mu_B}{\mu_N} = \frac{m_p}{m_e}$$

3. (c) : If we make a truth table for the outputs given in the question. It matches with the truth table of an NOR gate.

$$Y = \overline{A + B}$$

A	B	Y (output)
1	0	0
0	1	0
0	0	1

4. (c) : $\lambda \propto \frac{1}{\sqrt{T}}$

5. (b) : Specific resistance $\rho = \frac{RA}{l}$

$$= [ML^2T^{-3}A^{-2}] [L]$$

$$= [ML^3T^{-3}A^{-2}]$$

6. (c) : The reciprocal of impedance is admittance.

7. (c) : Let the reaction be represented as

$\therefore$ energy released in the reaction is 5 MeV

$$\Rightarrow \frac{1}{2} m_Y v_Y^2 + \frac{1}{2} m_\alpha v_\alpha^2 = 5 \text{ MeV}$$

$$\Rightarrow \frac{1}{2} (216) v_Y^2 + \frac{1}{2} 4 (v_\alpha)^2 = 5 \text{ MeV} \quad \dots (i)$$

Also using conservation of linear momentum.

$$m_Y v_Y = -m_\alpha v_\alpha \Rightarrow v_Y = \frac{-m_\alpha}{m_Y} v_\alpha$$

$$v_Y = \frac{-4}{216} v_\alpha = \frac{-1}{54} v_\alpha$$

Putting in eqn. (i)

$$\frac{1}{2} (216) \left(\frac{v_\alpha}{54} \right)^2 + \frac{1}{2} 4 (v_\alpha)^2 = 5 \text{ MeV}$$

$$\frac{1}{2} (216) \left(\frac{v_\alpha}{54} \right)^2 + \text{K.E.}_\alpha = 5 \text{ MeV}$$

$$\Rightarrow \frac{1}{2} \times 4 \frac{v_\alpha^2}{54} + \text{K.E.}_\alpha = 5 \text{ MeV}$$

$$\Rightarrow \frac{1}{54} (\text{K.E.}_\alpha) + \text{K.E.}_\alpha = 5 \text{ MeV}$$

$$\text{K.E.}_\alpha = \frac{5 \times 54}{55} = \frac{54}{11} \text{ MeV}$$

8. (a) : The resultant electric fields due to diagonally opposite charges will act as shown below.

Hence the resultant field is along DC.

9. (a) : Wavelengths of the K_α lines for given isotopes of lead (Pb) can be given by a general expression

$$\frac{1}{\lambda} = R(Z-1)^2 \left(\frac{1}{1^2} - \frac{1}{2^2} \right)$$

where R = Rydberg's constant, Z = atomic number of the isotopes. Though Pb^{208} , Pb^{206} and Pb^{204} have different atomic masses, Z will be same for them i.e. 82.

$$\therefore \frac{1}{\lambda_1} = R(82-1)^2 \left(\frac{1}{1^2} - \frac{1}{2^2} \right) = \frac{3}{4} R(81)^2$$

$$\frac{1}{\lambda_2} = \frac{3}{4} R(81)^2 \text{ and } \frac{1}{\lambda_3} = \frac{3}{4} R(81)^2$$

$$\Rightarrow \left(\frac{1}{\lambda_2} \right)^2 = \frac{1}{\lambda_1} \times \frac{1}{\lambda_3} \Rightarrow \lambda_2 = \sqrt{\lambda_1 \lambda_3}$$

10. (a) : Work done by force = Area under force-displacement graph.

$$= 3 \times 3 + \frac{1}{2} \times 3 \times 3 = 9 + 4.5 = 13.5 \text{ J}$$

11. (d) : Since $k \propto \frac{1}{l}$

12. (c) : At maximum compression the whole kinetic energy of ball = potential energy of spring.

$$\frac{1}{2} mv^2 = \frac{1}{2} kx^2 \Rightarrow x = v \sqrt{\frac{m}{k}}$$

$$x = 1.5 \times \sqrt{\frac{5}{5}} = 1.5 \text{ m}$$

13. (c)

14. (d) : Radiation pressure P_{rad} due to light falling on a non-reflecting surface at normal incidence is given by

$$P_{\text{rad}} = \frac{\text{Energy flux}}{\text{Speed of light}} = \frac{18 \text{ W/cm}^2}{3 \times 10^8 \text{ m/s}}$$

$$= \frac{18 \times 10^4 \text{ W/m}^2}{3 \times 10^8 \text{ m/s}} = 6 \times 10^{-4} \text{ N/m}^2$$

15. (a)

16. (b) : After 0.7 sec the horizontal velocity component of the body = $4\sqrt{2} \text{ m/sec}$ since there is no change in velocity in horizontal direction.

The vertical velocity component after 0.7 seconds
 $= 0 + gt = 0 + 0.7 \times 10$
 $= 7 \text{ m/sec}$

$$\therefore \text{resultant velocity of the body} = \sqrt{(4\sqrt{2})^2 + 7^2}$$

$$= \sqrt{32 + 49} = 9 \text{ m/sec}$$

17. (d) : Three equal weights of 3 kg each are hanging

on a string passing over a pulley as shown in figure.

If a is the common acceleration.

$$T - 3g = 3a \text{ (For mass I)}$$

$$3g + T_1 - T = 3a \text{ (For mass II)}$$

$$3g - T_1 = 3a \text{ (For mass III)}$$

Adding, above three equations

$$3g = 9a, a = g/3$$

$$T_1 = 3g - 3a = 3g - g = 2g = 20 \text{ N}$$

18. (a) : The ball falls a distance h from its highest (rest) position and rebounds a distance $(h-d)$.

Thus the coefficient of restitution $e = \sqrt{\frac{h-d}{h}}$

$$e^2 = \frac{h-d}{h} \text{ or } h = \frac{d}{1-e^2}$$

19. (a) : The capacitances of two are $C_1 = 4\pi\epsilon_0 R$ and $C_2 = 4\pi\epsilon_0 (2R)$

$$\text{Initial energy} = E_i = \frac{Q^2}{2C_1}$$

$$\text{Final energy} = E_f = \frac{Q^2}{2C_2}$$

$$\text{Heat produced} = E_i - E_f$$

$$= \frac{Q^2}{2} \left[\frac{1}{4\pi\epsilon_0 R} - \frac{1}{2 \times 4\pi\epsilon_0 R} \right]$$

$$= \frac{1}{4\pi\epsilon_0} \cdot \frac{Q^2}{2R} \left[1 - \frac{1}{2} \right]$$

$$= \frac{1}{4\pi\epsilon_0} \cdot \frac{Q^2}{4R}$$

20. (b) : $\lambda_m T = 2.898 \times 10^{-3} \text{ mK}$

$$\lambda_m = \frac{2.9 \times 10^{-3}}{10^6} = 2.9 \times 10^{-9} \text{ m} = 2.9 \text{ nm. It lies in the X-ray region of the electromagnetic spectrum.}$$

21. (a) : The terminal velocity of the spherical raindrop of radius r is given by

$$v_t = \frac{2r^2 \rho g}{9\eta} \text{ where } \rho \text{ is the density of water and } \eta \text{ the viscosity of air. Substituting } r = 0.3 \text{ mm}$$

$$= 0.3 \times 10^{-3} \text{ m}, \rho = 10^3 \text{ kg/m}^3, g = 9.8 \text{ m/s}^2 \text{ and}$$

$$\eta = 1.8 \times 10^{-5} \text{ N s/m}^2, \text{ we get}$$

$$v_t = \frac{2 \times (0.3)^2 \times 10^{-3} \times 9.8}{9 \times 1.8 \times 10^{-5}}$$

$$= 10.9 \text{ m s}^{-1}$$

22. (b) : Let the simple harmonic equation for the particle be $x = l \sin \omega t$... (i)

where ω is its angular velocity.

Since the S.H.M. of the rod has the same period and amplitude and its vibration is perpendicular to that of the particle, its equation is $y = l \cos(\omega t + \phi)$ where ϕ is the initial phase difference (phase angle for y). But both the particle as well as the rod pass through the mean position simultaneously. Hence $\phi = \pi/2$ since $x = y = 0$ at $t = 0$.

$$\text{So, } y = l \cos(\omega t + \pi/2) = -l \sin \omega t \quad \dots \text{(ii)}$$

Eliminating t between (i) and (ii), we have

$$y = -x$$

which is the equation to a straight line at angle $\pi/4$ to the rod.

23. (a) : Network is redrawn as shown in figure.

This is a balanced Wheatstone's network.

Equivalent capacitance $C_{eq} = C$

Charge on capacitor between the terminals a and b

$$\frac{Q}{2} = \frac{CV}{2}$$

Energy stored in that capacitor

$$= \frac{1}{2} \left(\frac{Q}{2} \right)^2 = \frac{Q^2}{8C} = \frac{C^2 V^2}{8C} = \frac{CV^2}{8}$$

Given: $C = 1 \mu\text{F}$, $V = 10 \text{ V}$

$$= \frac{(1 \times 10^{-6}) \times 10^2}{8}$$

$$= \frac{100}{8} \times 10^{-6} = 12.5 \mu\text{J}$$

24. (b) : $H = I^2 R t = mc \Delta \theta$

$$\therefore \Delta \theta \propto I^2$$

$$\text{Hence } \frac{\Delta \theta_2}{\Delta \theta_1} = \left(\frac{I_2}{I_1} \right)^2 \text{ or } \frac{\Delta \theta_2}{3} = \left(\frac{3I}{I} \right)^2$$

$$\text{or } \Delta \theta_2 = 9 \times 3 = 27^\circ \text{C}$$

25. (a) : According to positive Thomson's effect the potential at a point of lower temperature is lower than at the point at higher temperature which is at higher potential. When current is passed from lower temperature to higher temperature of a metal, work is to be done, hence energy is absorbed.

26. (b) : $I_s = 0.1I$, $I_g = 0.9I$; $S = I_g G/I_s$

$$= 0.1 \times 900/0.9 = 100 \Omega$$

27. (c) : Since the magnetic field, due to current through wire CD at various locations on wire AB is not uniform, therefore, the wire AB , carrying current I_1 is subjected to variable magnetic field due to which, neither the force nor the torque on the wire AB will be zero. As a result of which the wire AB will have both translational and rotational motions.

28. (b) : Inductance of a coil is given by

$$L = \frac{1}{2} \mu_0 \pi N^2 R \Rightarrow \frac{L_2}{L_1} = \frac{N_2^2}{N_1^2}$$

$$\therefore L_2 = L_1 \frac{N_2^2}{N_1^2} = \left(\frac{500}{100} \right)^2 15 \text{ mH} = 375 \text{ mH}$$

29. (c) : As $V_R = V_L = V_C$

$$R = X_L = X_C, Z = R$$

$$V = IR = 10 \text{ volt}$$

When capacitor is short circuited,

$$Z = \sqrt{R^2 + X_L^2} = \sqrt{R^2 + R^2} = R\sqrt{2}$$

$$\text{New current } I' = V/Z = V/R\sqrt{2} = \frac{10}{R\sqrt{2}}$$

Potential drop across inductance

$$= I'X_L = I'R = \frac{10 \times R}{R\sqrt{2}} = \frac{10}{\sqrt{2}} \text{ volt}$$

30. (d)

31. (d)

32. (a) : When sources are coherent, intensity at mid point is

$$I_{\max} = (a + a)^2 = 4a^2$$

When sources are incoherent, no interference occurs. Intensity at mid point is

$$I = I_1 + I_2 = a^2 + a^2 = 2a^2$$

$$\therefore \frac{I_{\max}}{I} = \frac{4a^2}{2a^2} = 2:1$$

33. (b) : $\lambda = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$ or $\lambda \propto \frac{1}{\sqrt{E}}$

$$\therefore \frac{\lambda'}{\lambda} = \sqrt{\frac{E}{E'}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$$

$$\begin{aligned} \% \text{ change in wavelength} &= \left(\frac{\lambda - \lambda'}{\lambda} \right) \times 100 \\ &= \left(1 - \frac{\lambda'}{\lambda} \right) \times 100 = \left(1 - \frac{1}{4} \right) \times 100 = 75\% \end{aligned}$$

34. (a) : $T = \frac{T_\alpha T_\beta}{T_\alpha + T_\beta} = \frac{4 \times 12}{4 + 12}$

$$n = \frac{t}{T} = \frac{12}{3} = 4$$

$$\frac{N}{N_0} = \left(\frac{1}{2} \right)^n = \left(\frac{1}{2} \right)^4 = \frac{1}{16} = 6.25\%$$

35. (c) : Here p-n junction is forward biased. If p-n junction is ideal, its resistance is zero. The effective resistance across A and B

$$= \frac{10 \times 10}{10 + 10} = 5 \text{ K}\Omega$$

Current in the circuit

$$I = \frac{30}{(10 + 5) \times 10^3} = \frac{2}{10^3}$$

$$\therefore \text{Current in each arm} = \frac{I}{2} = \frac{1}{10^3} \text{ A.}$$

Pot. diff. across A and B

$$= \frac{1}{10^3} \times 10 \times 10^3 = 10 \text{ V}$$

36. (a) : $\theta = \theta_0 \sin \omega t$ $\omega = \sqrt{\frac{g}{L}}$

$$\therefore T = 2\pi \sqrt{\frac{L}{g}}$$

When $\beta > \alpha$, time taken by pendulum from B to C and C to B

$$t_1 = \frac{T}{2} = \frac{1}{2} \times 2\pi \sqrt{\frac{L}{g}} = \pi \sqrt{\frac{L}{g}}$$

Time taken by pendulum from B to A and A to B

$$t_2 = 2t = \frac{2}{\omega} \sin^{-1} \left(\frac{\alpha}{\beta} \right) \text{ using } \theta = \theta_0 \sin \omega t$$

$$\alpha = \beta \sin \omega t \text{ or } t = \frac{1}{\omega} \sin^{-1} \left(\frac{\alpha}{\beta} \right)$$

 $\therefore$ Time period of motion

$$T = t_1 + t_2 = \sqrt{\frac{L}{g}} \left[\pi + 2 \sin^{-1} \frac{\alpha}{\beta} \right]$$

37. (d) : Maximum number of nuclei will be present, when rate of decay = rate of formation

$$\lambda \cdot N = \alpha, \quad N = \frac{\alpha}{\lambda}$$

38. (c) : Consider two small elements each of length $dl = r d\theta$ symmetrically.

$$\pi r = l$$

Resolve the elemental field intensities

$$\therefore |dE_1| = |dE_2|$$

$$dE = 2dE_1 \cos \theta = \frac{2Gr d\theta}{r^2} \cos \theta$$

G = Gravitational constant

$$\lambda = \text{Linear mass density} = \frac{m}{l}$$

$$\text{or } dE = \frac{2\lambda G}{r} \int_0^{90^\circ} \cos \theta d\theta = \frac{2\lambda G}{r} = \frac{2\pi G m}{l^2}$$

39. (a) : Using $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

Given $u = f + d_1$ $v = f + d_2$

$$f = \frac{uv}{u+v} = \frac{(f+d_1)(f+d_2)}{(f+d_1)+(f+d_2)}$$

On solving $f = \sqrt{d_1 d_2}$

40. (c) : Use $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

Find v_1 , when $u = d$ and v_2 , when $u = d + l$

$$\text{Size of image} = v_1 - v_2 = l \left(\frac{f}{d-f} \right)^2$$

41. (c) : When a solid changes into a liquid, the work done against the attraction of molecules is stored in the form of potential energy.

42. (b) : When ball is completely filled with water, the centre of gravity of the pendulum is at the centre of the ball when water starts flowing out, the centre of gravity shifts below, thus increasing the length of pendulum, and increasing time period. When ball is more than half empty the centre of gravity again rises up so length of pendulum decreases and time period also decreases.

43. (c) : Electric potential of earth is taken as zero, because the capacitance of earth is taken infinite.

44. (d) : A charge, whether stationary or in motion, produces an electric field around it. If it is in motion, then in addition to the electric field, it also produces a magnetic field, because moving charges produce magnetic field in the surrounding space.

45. (c) : Magnetic susceptibility (χ_m) is defined as the ratio of the intensity (I) of magnetisation to the magnetic intensity (H) of the magnetising field, that is

$$\chi_m = \frac{I}{H}$$

It is a pure number, because I and H have the same unit. Its value for vacuum is zero as there can be no magnetisation in vacuum.

46. (a) : Transformers which convert low voltages into higher ones are called step-up transformers, while those which convert high voltages into

lower ones are called step-down transformers. This is possible only for a.c. source and not for d.c. source.

47. (a) :

Beam of light incident on face AB, suffers refraction from air to glass and strikes the face AC suffering total internal reflection. The beam now strikes the face BC of the prism at an angle of incidence less than the critical angle hence it suffers refraction from glass to air and bends away from the normal. The beam emerges out parallel to the base. As a result of refraction, on emergence the rays are inverted.

48. (a) : The rays of all colours incident on a concave mirror at the same angle are reflected at the same angle. Hence image formed by reflection does not suffer chromatic aberration.

49. (a) : Equivalent mass of photon (m) is given from equation

$$E = mc^2 = h\nu \therefore m = \frac{h\nu}{c^2}$$

Where E is energy, m is mass, c is speed of light, h is Planck's constant, ν is frequency.

$$\therefore \text{Momentum of photon} = m \times \frac{h\nu}{c^2} \times c = \frac{h\nu}{c}$$

50. (b) : Photo-conductive cell is based on the principle that when light is incident on some semiconductor, its electrical resistance is reduced. Such cells are used in solar batteries. Whereas photocell is used in electrolyte for giving theft warning in banks treasuries, etc., when the thief throws torch light on the cash box, the light is incident on a photocell placed there and a bell at some particular place rings.

51. (b) : The nuclei having mass number $A \approx 60$ have maximum binding energy per nucleon (about 8.7 MeV). So, these nuclei are most stable.

52. (c) : We know that

$$\alpha = \frac{\Delta i_C}{\Delta i_E} \text{ and } \beta = \frac{\Delta i_C}{\Delta i_B}$$

is square pyramidal with 1 lone pair, TeF_4 is see-saw shaped with 1 lone pair, SeCl_4 has see-saw shape with 1 lone pair, XeF_4 has planar shape with 2 lone pairs.

84. (c): Stability of superoxides increases with increase in size and electropositivity of the metal. Hence the order $\text{CsO}_2 > \text{RbO}_2 > \text{KO}_2$.

85. (b)

86. (c): $(\text{CH}_3)_3\text{CO}^-$ is a better base than a nucleophile. Hence elimination occurs. The product formed is resonance stabilised.

87. (a): Equivalent weight of metal carbonate
 $= 20 + 30 = 50$

2.5 g of metal carbonate $= \frac{2.5}{50} = 0.05$ eq.

Number of equivalent of H_2SO_4 would have reacted = 0.05

Number of equivalent of H_2SO_4 taken

$$= \frac{100 \times 1}{1000} = 0.1$$

Number of equivalent of H_2SO_4 remains unreacted
 $= 0.1 - 0.05 = 0.05$ eq.

$\therefore$ Number of equivalent of alkali consumed
 $= 0.05$ eq.

milli eq. = Normality $\times$ Volume in mL

$$\therefore 1.0 \times V = 0.05 \times 1000$$

$$V = \frac{0.05 \times 1000}{1.0} = 50 \text{ ml}$$

88. (c): In methyl alcohol, F^- ion is solvated but in DMSO or CH_3CN (aprotic solvent) F^- ion is not solvated. Unsolvated F^- ion acts more efficiently as a nucleophile.

89. (d): Being covalent, BeF_2 has the lowest melting point (800°C) while other fluorides melt at around 1300°C .

90. (b): Because of its smallest size, Li^+ has highest hydration energy and hence the highest stability of hydrated Li^+ ion.

91. (d): When the ends of alkene containing n double bonds are different, the number of geometrical isomers is 2^n . Thus for

Number of geometrical isomers $= 2^2 = 4$

When the ends of alkene containing n double bonds are same, then the number of geometrical isomers $= 2^{n-1} + 2^{n-1}$

where $p = \frac{n}{2}$ for even n and $\frac{n+1}{2}$ for odd n , thus for

Number of geometrical isomers

$$= 2^{2-1} + 2^{2-1} = 2^1 + 2^0 = 2 + 1 = 3.$$

92. (a): $\alpha\text{-D glucose} \rightleftharpoons \beta\text{-D glucose}$

Initial 1 0

At equilibrium $1 - \alpha$ α

$$K = \frac{\alpha}{1 - \alpha} = 1.8$$

Solving $\alpha = 0.642$

$$1 - \alpha = 0.358$$

Percent of $\alpha\text{-D glucose}$ remaining at equilibrium
 $= 35.8\%$.

93. (b): 

It is a primary bromide. So it will undergo elimination either by E2 or E1cB. Since there is no deuterium exchange in $\text{C}_2\text{H}_5\text{OD}$ solvent, C - H bond is not broken to form carbanion. Hence the actual mechanism is E2 only.

94. (a): 

In OF_2 repulsion between lone pairs is greater than that between bond pair since electrons are away from O and nearer to F. In Cl_2O , bonding electrons are nearer to O than to Cl, so the bond angle is greater than $109^\circ 28'$. In Br_2O , the bonding electrons are more closer to oxygen than in Cl_2O , so the bond angle is largest (116°).

95. (a): $\alpha = \frac{\Lambda_c}{\Lambda_m} = \frac{176.2 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}}{405.2 \Omega^{-1} \text{ cm}^2 \text{ mol}^{-1}} = 0.435$

$$K = \frac{[\text{H}^+][\text{F}^-]}{[\text{HF}]} = \frac{C\alpha^2}{1 - \alpha} = \frac{(0.002 \text{ M})(0.435)^2}{1 - 0.435}$$

96. (c): In Oppenauer's oxidation, secondary alcohol is oxidised to corresponding ketone in the presence of aluminium tertiary butoxide. Other oxidisable groups are not affected.

97. (c): GeCl_4 is more stable than GeCl_2 . Ge has greater tendency to form +4 state than +2 state.

98. (a): The entropy change for a process, when T and P are the variables is given by

$$\Delta S = C_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$$

For an isobaric process $P_1 = P_2$. Hence the above equation reduces to

$$C_p \ln \frac{T_2}{T_1} = \Delta S.$$

$$\text{or } \Delta S = 2.303 C_p \log \frac{T_2}{T_1}.$$

99. (b):  + $\text{CH}_3-\text{C}\equiv\text{N} \rightarrow$

Thus in both cases, the same product, cyclohexyl methyl ketones is formed.

100. (a): Alkyl halides are starting materials for Grignard reagents which are used for preparing number of organic compounds.

101. (a): It is a temporary effect. It comes into play instantaneously at the demand of the attacking reagent and as soon as the attacking reagent is removed the original condition is restored.

This effect is applicable on a multiple bond.

102. (c): CaCl_2 forms addition products with alcohol and ammonia. ($\text{CaCl}_2 \cdot 4\text{NH}_3$ or $\text{CaCl}_2 \cdot 4\text{C}_2\text{H}_5\text{OH}$).

103. (a)

Alkaline KMnO_4 always gives *cis*-addition on olefins.

105. (a)

106. (a)

107. (b): Ag^+ forms complex with the alkene by $p\pi-d\pi$ bonding giving an ion and the solubility increases.

108. (c): $\Delta G = \Delta H - T\Delta S$

-ve = $\Delta H - [T(-ve)]$ (as spontaneous)

Exothermic reactions may be accompanied by increase or decrease of randomness.

109. (a): In case of H_2 , compressibility factor increases with the pressure. At 273 K, $Z > 1$ which shows that it is difficult to compress the gas as compared to ideal gas. In this case, repulsive force dominates.

111. (c): As atoms in S_8 molecule undergo sp^3 hybridisation and contain two lone pairs of electrons on each and exists as staggered 8 atoms-rings.

112. (a): Formate ion shows resonance and gives rise to identical bond lengths.

113. (b): The lone pair electrons on N atom in $AgNO_2$ attacks C_2H_5Br to form nitroethane as the major product.

114. (d): Increase in pressure favours melting of ice into water because at higher pressure melting point of ice is lowered.

According to Le-Chatelier's principle, if pressure is increased the equilibrium will shift in direction which produces smaller number of moles.

115. (b): Ebonite is a very hard rubber contains

30-40% sulphur.

116. (c): B does not have vacant d -orbitals (sub-shell) as its valence shell.

117. (c): It is known that esters with α -hydrogens form carbanion when treated with base. It brings about nucleophilic substitution at the carbonyl group of the other molecule of the ester to yield β -keto ester. $LiAlH_4$ reduces esters to alcohols.

118. (d): In a titration of strong base and weak acid phenolphthalein is used as indicator. Methyl orange changes its colour in pH of range 3 to 5.

119. (b): Millon's test is used for proteins. When Millon's reagent is added to the aqueous solution of a protein, a white precipitate is formed.

120. (a)

BIOLOGY

121. (d): WBCs can change their shape like *Amoeba* and are thus, capable of amoeboid movement. This enables them to squeeze out of blood capillaries into the tissues. This process is called diapedesis.

122. (b): Valium is a benzodiazepine (sedative) that gives a feeling of relaxation, calmness or drowsiness in the body. Morphine is the main opium alkaloid that depresses respiratory centre and contributes to the fall in blood pressure. Amphetamines are synthetic drugs and are stimulant in nature. Hashish is a hallucinogen.

123. (b): The organ of Corti consists of outer hair cells, inner hair cells, inner pillar cells, outer pillar cells, tunnel of Corti, phalangeal cells (cells of Deiters), cells of Hensen and cells of Claudius. The sensory hairs project from the outer ends of the hair cells into the scala media, while from the inner end of the cells nerve fibres arise, which unite to form the cochlear nerve.

124. (b)

125. (a): *Homo erectus* appeared about 1.7 million years ago in middle pleistocene. *H. erectus* evolved from *Homo habilis*. He was about 1.5-1.8 metres tall.

126. (d)

127. (c): *Entamoeba histolytica* is a monogenetic parasite, i.e., living in a single host, in the large intestine

of humans. It causes amoebiasis or amoebic dysentery.

128. (b) : The ventral nerve cord, as its name suggests, is a cord of nervous tissue that runs the length of the animal in the lower part of its body. It is the characteristic of lower chordates like leech, cockroach and scorpion.
129. (c) : Ciliated epithelium is a region of epithelium consisting of columnar or cuboidal cells bearing hairlike appendages that are capable of beating rapidly. Ciliated epithelium performs the functions of moving particles of fluids over the epithelial surface. Cuboidal ciliated epithelium occurs in certain parts of uriniferous tubules whereas columnar ciliated epithelium occurs in fallopian tubules, nasal passages, bronchioles, small bronchi and buccopharyngeal cavity of frog. It often occurs in the vicinity of mucus secreting goblet cells.
130. (a) : Borderline personality disorder (BPD) is a serious mental illness. Borderline describing a personality disorder characterized by unstable and intense relationships, exploiting and manipulating other people, rapidly changing moods, recurrent suicidal or self injuring acts & a pervasive inner feelings of emptiness & boredom.
A mood disorder is a condition where the prevailing emotional moods are distorted or inappropriate to the circumstances. Addiction is a state of dependence produced by the habitual taking of drugs, alcohol etc. Schizophrenia is a group of severe mental disorders characterized by disturbances of languages and communications, thought disturbances that may involve distortion of reality, misperceptions, delusions and hallucination, mood changes etc.
131. (b) : At sexual maturity, the undifferentiated primordial germ cells divide several times by mitosis to produce a large number of spermatogonia. Each spermatogonium then actively grows to a larger primary spermatocyte. Each primary spermatocyte undergoes two successive divisions, called maturation divisions. The first maturation division is reductional or meiotic. Hence, the primary spermatocyte divides into the haploid daughter cells called secondary spermatocytes.
132. (d) : Oral contraceptive pills inhibit ovulation and implantation. They have to be taken daily

for 21 days starting within the first five days of menstrual cycle. After a gap of 7 days, it has to be repeated.

133. (b) : Patella is a sesamoid bone. Sesamoid bones are small rounded masses of bones formed in tendons at the joints where they are subjected to great pressure.
134. (a)
135. (b) : Secretin and cholecystokinin are secreted by Brunner's gland located in duodenum. Secretin causes the pancreas to secrete alkaline pancreatic juice and stimulates bile production in the liver. Cholecystokinin induces the gall bladder to contract and eject bile into the intestine and stimulates the pancreas to secrete its digestive enzymes.
136. (c) : The chromosome complement of *Triticum aestivum* ($2n = 26$) is similar to that of *Gossypium* whose ploidy level is also $2n = 26$. *Zea mays* has ploidy level of $2n = 20$. *Secale* and *Aegilops* both have the similar ploidy level of $2n = 14$.
137. (b) : Eugenics is the study of methods of improving the quality of human populations by the application of genetic principles. Positive eugenics would seek to do this by selective breeding programmes. Negative eugenics aims to eliminate harmful genes (e.g., those causing haemophilia and colour blindness) by counselling any prospective parents who are likely to be carriers.
138. (c) : DNA polymerase can polymerize nucleotides only in $5' \rightarrow 3'$ direction on $3' \rightarrow 5'$ strand because it adds them at the $3'$ end. Since the two strands of DNA run in antiparallel directions, the two templates provide different ends for replication. Replication over the two templates thus proceeds in opposite directions. One strand with polarity $3' \rightarrow 5'$ forms its complementary strand continuously because $3'$ end of the latter is open for elongation. It is called leading strand. Replication is discontinuous on the other template with polarity $5' \rightarrow 3'$ because only a short segment of DNA strand can be built in $5' \rightarrow 3'$ direction due to exposure of a small stretch of template at one time. Short segments of replicated DNA are called Okazaki fragments.
139. (d) : Photosystem I is located in the nonappressed part of grana thylakoids as well as stroma thylakoids. In this photosystem chlorophyll :

carotenoid content is high. Its photocentre is P_{700} . Pigment molecules of PS I absorb at or below 700 nm wavelength of light. It receives electrons from photosystem II. Photosystem I is involved in both cyclic and non cyclic photophosphorylation. It is not connected with photolysis of water. Usually it hands over its electron to $NADP^+$.

140. (d) : Bark is a loose term and is used to define all the tissues outside vascular cambium. It is differentiated into outer bark or rhytidome (consisting of dead cells) and inner bark (of living cells, i.e., periderm, cortex, pericycle and secondary phloem). The outer layers of the bark are being constantly peeled off on account of the formation of new secondary vascular tissues in the interior. Bark is insect repellent, decay proof, fire-proof and acts as a heat screen.

141. (a) : The cotton fibres represent epidermal prolongations of seed coat cells. A raw cotton fibre, on average, gives the following values on analysis : cellulose, 94%, protein - 1.3%, pectic substances - 0.9%, ash - 1.2%, wax - 0.6%, sugars - 0.3% and traces of pigments and mineral matter.

142. (b) : Mycoplasma are the smallest and simplest free living Gram negative prokaryotes or monerans. A cell wall is absent. Plasma membrane forms the outer boundary of the cell. A substantial amount of polysaccharides having acetyl glucosamine are associated with cell membrane.

143. (a) : Sexual reproduction in *Spirogyra* takes place by the process of conjugation. In *Spirogyra*, the process of conjugation may be of two types - scalariform conjugation and lateral conjugation. Scalariform conjugation occurs in heterothallic species. Lateral conjugation occurs between the adjacent cells of the same filament of homothallic species of *Spirogyra*. Lateral conjugation are of two types. They are indirect lateral conjugation (chain type) and direct lateral conjugation.

144. (c) : Sucrose, glucose and fructose, all the three sugars are found in plants. Sucrose is the commercial sugar which is obtained from sugarcane. Glucose is the main respiratory substrate in plants and animals. Fructose can also function similarly. Moreover fructose is also the common fruit sugar.

Lactose or milk sugar is found naturally in milk. It is reducing sugar which is formed in the mammary glands of mammal through

condensation of two hexose molecules.

145. (d) : The binding site of tRNA with mRNA is anticodon loop and with amino acid is CCA end, as shown in the figure.

146. (d) : 1 map unit or centimorgan is equivalent to 1% recombination between two genes. The frequency of recombination can be used to depict the arrangement of the genes. Recombination frequency between three genes is

$$\begin{aligned} A - B &= 9\% \\ A - C &= 17\% \text{ and} \\ B - C &= 26\% \end{aligned}$$

By manipulating the three possibilities of their arrangements $A - B - C$, $A - C - B$ and $B - A - C$, it was found that the three gene must be arranged in the order $B - A - C$ with distance between $B - A$ being 9 cM and $A - C$ being 17 cM and the distance between $B - C$ being 26 cM.

147. (d) : Spike is a racemose inflorescence that bears sessile flowers in an acropetal fashion, e.g., chaff flower (*Achyranthes*), bottle brush (*Callistemon*), *Adathoda vasica*, *Amaranthus*.

148. (b) : Lignin is a complex organic polymer that is deposited within the cellulose of plant cells. The lignin content is high in jute fibres which causes deterioration very quickly.

149. (d) : Sclereids are highly thickened dead sclerenchyma cells with very narrow cavities. They may also be branched. They provide stiffness to the parts in which they occur. Sclereids are of many types: brachysclereids, macrosclereids, osteosclereids, astrosclereids, trichosclereids and filiform sclereids. Astrosclereids are star-shaped, having various branches or arms. They are found in intercellular spaces of leaves and stems of many hydrophytes like *Nymphaea*.
150. (c) : Oxalosuccinate is decarboxylated to form α -ketoglutarate through the enzyme decarboxylase. It is one of the step involved in Krebs' cycle. It releases one molecule of CO_2 .
- $$\text{Oxalosuccinate} \xrightarrow[\text{Mg}^{2+}]{\text{Decarboxylase}} \alpha\text{-ketoglutarate} + \text{CO}_2$$
151. (c) : In electron transport chain electrons transport through a series of carriers. H^+ of NADH^+ (received from Krebs cycle) is accepted by FAD as a result of which FAD is reduced to FADH^+ and NADH^+ is oxidised to NAD. Reduced FADH^+ is oxidised by CoQ, with the formation of CoQH^+ . H^+ ions then move to Cyt b, then Cyt c, Cyt a and Cyt aa_3 . Ultimately these H^+ are accepted by O_2 and H_2O is formed.
152. (d) : Plants require many organic and inorganic nutrients to complete their life-cycle. It has been established that some elements are required by plants in relatively large amount and are called major elements or macronutrients, e.g., C, H, O, N, S, P, K, Ca and Mg. Microelements or minor elements or trace elements are required by plants in very small amount, less than 1ppm. E.g., Fe, Cu, B, Zn, Mn, Mo, Cl. Thus Cr is not a microelement.
153. (c) : The common peafowl or peacock, *Pavo cristatus*, called 'Mor' or Mayur' in hindi, is the national bird of India. It occurs throughout India upto 1650 meters in the himalayas. It displays a well-marked sexual dimorphism, the male having a gorgeous ocellated tail.
154. (d) : Acid rain is rainfall and other forms of precipitation with a pH less than 5. pH of normal rain is 5.6 – 6.5. It is caused by the large scale emission of acidic gases into the atmosphere from thermal power plants, industries and automobiles.
155. (d) : Interferon is a group of proteins that increases the resistance of cells to viral infection. Interferon also acts as cytokines and can enhance some immune responses. Three types of interferons have so far been discovered, alpha, beta and gamma, all of which have immune-modulating effects. Interferons are used in the treatment of cancer and autoimmune diseases.
156. (d) : Bacteria become resistant to antibiotic by either producing enzymes or forming impermeable capsule and modifying the target of the drug.
157. (b) : Active transport is the uphill movement of materials across the membrane where the solute particles move against their concentration gradient or electro-chemical gradient. It takes place through the agency of special organic molecules called carrier molecules, carrier particles or carrier proteins. There is a special carrier molecule for each solute particle (ion or molecule). The carrier has its binding site on two surfaces of the membrane. The solute particle (or substrate) combines with the carrier to form carrier solute complex. In the bound state the carrier undergoes a conformational change which transports the solute to the other side of the membrane. Here the solute is released. Energy is used in bringing about the conformational change in the carrier. It is provided by ATP.
158. (d) : Co-dominance is the phenomenon when the two genes neither show dominant-recessive relationship nor show intermediate condition, but both of them express themselves simultaneously. This has been reported in roan character of cattle (i.e., patches of 2 different colours on the skin).
159. (a) : The first bioherbicide is devine, which is a mycoherbicide, based on fungus *Phytophthora palmivora*. It is being used since 1981 to control *Morrenia odorata* (milkweed vines) in *Citrus* orchards.
160. (c) : Ripened ovary or fertilized ovary is called fruit. The wall of the ovary forms fleshy or dry fruit wall known as pericarp. It means that the pericarp is developed from pistil or carpel.
161. (a) : Biotic or ecological succession is the formation of a series of biotic communities at the same site over a period of time one after the other, till a stable climax community develops over the area. It occurs generally in bare areas. Primary succession

takes place on a biological sterile soilless primary barren area. Secondary succession takes place in a recently denuded area which still contains a lot of organic debris, remains and propagules of previous living organisms. The area has become bared due to destruction of the community previously present. The baring of an area can be caused due to forest fire, deforestation for wood, timber and habitat, overgrazing, landslides or earthquakes, excessive and repeated droughts, following a cropland and repeated floods.

162. (d) : Connective tissue consists of variously shaped cells lying in an extracellular material called matrix. It joins one tissue to another in the organs. Connective tissue is absent inside the central nervous system i.e. brain and spinal cord and thus has no function in the conduction of nerve impulse. The nerve cells of the brain and spinal cord are held together by supporting cells called neuroglia cells.
163. (a) : Based on the mode of secretion, the glands are of three types : mesocrine, apocrine and holocrine. Mammary glands that are present in mammals to feed the young ones with milk are the example of apocrine glands. In apocrine glands, the secretion accumulates as secretory granules in the distal part of the cell. This part later breaks down and leaves as a secretion.
164. (b) : Application of cytokinins to marketed vegetables can keep them fresh for several days. Shelf life of cut shoots and flowers is prolonged by employing the hormone cytokinin. The reason is that the cytokinin increases retention of chlorophyll and delayed senescence in leaves. Cytokinin as the name suggests, is essential for cell division or cytokinesis. It promotes cell division along with auxin by controlling the activity of cyclin dependent kinases.
165. (c) : Angina pectoris literally means "pain in the chest". It results from arteriosclerosis of the arteries that supply the heart muscle itself, i.e., the coronary arteries. Arteriosclerosis is the hardening of arteries and arterioles due to thickening of the fibrous tissue, and the consequent loss of elasticity. Due to the lack of required expansion, the arteries are unable to carry extra blood to the heart muscle at the time of stress when the heart is beating more vigorously. Deprived of oxygen the heart

muscle experiences constricting pain.

166. (b) : Most of the animals have sex organs. They are either males or females. But in some lower animals, the organs of both the sexes are found in the same individual. These are called bisexual or monoecious animals or hermaphrodites. In these animals, testes and ovaries do not mature simultaneously. For example in earthworm, testes mature earlier, while in others, e.g., sea-squirt, ovaries mature earlier. These conditions are respectively called protandry and protogyny. They ensure cross fertilization. Cross fertilization is a process in which gametes derived from different individuals are united to form zygote. It involves the mixing of two different genetic materials. This is better than self-fertilization as it introduces variation by combining traits of two individuals.
167. (d) : A small, glandular, blind pouch of lymphatic tissue, the bursa lies on the dorsal side of the cloaca. It is lined with endoderm, and opens into the proctodaeum. In a young bird, bursa fabricii forms lymphocytes, and probably it produces antibodies and protects against local infection, but it atrophies in the adult before sexual maturity. It is also called cloacal thymus, because like thymus, it secretes lymphocytes. Thus it is not related with flight adaptation, rather it helps in immunity.
168. (d) : Glycolysis is the process of breakdown of glucose or similar hexose sugar into two molecules of pyruvic acid through a series of enzyme mediated reactions, releasing energy (ATP) and reducing power (NADH_2). It is the first step of respiration, which occurs inside the cytoplasm and is independent of O_2 . In glycolysis, two molecules of ATP are consumed during double phosphorylation of glucose to form fructose 1, 6 diphosphate. Four molecules of ATP are produced in the conversion of 1, 3-diphosphoglycerate to 3-phosphoglycerate and phosphoenol pyruvate to pyruvate whereas, two molecules of NADH_2 are formed during oxidation of glyceraldehyde 3-phosphate to 1, 3-diphosphoglycerate. Since, each NADH is equivalent to 3 ATP, so net gain in glycolysis is 8 ATP.
169. (c) : Restriction enzyme, a type of endonuclease, functions by "inspecting" the length of a DNA sequence. Once it finds a recognition sequence,

it binds and cut each of the two strands of the double helix at specific point leaving single stranded portions at the ends. This results in overhanging stretches called sticky ends. These are named so because they form hydrogen bonds with their complementary counter parts i.e. they can join similar complementary ends of DNA fragment from some other source with the help of DNA ligase. This stickiness of the ends facilitates the action of the enzyme DNA ligase, not DNA polymerase.

170. (a): Excess of nitrates in drinking water are harmful for human health and may be fatal for infants. Excessive use of fertilizers often leads to accumulations of nitrates in water. In infants excess nitrate reacts with haemoglobin to form nonfunctional methaemoglobin that impairs oxygen transport. This condition is termed as methaemoglobinemia or blue baby syndrome. The disease can damage respiratory and vascular systems and even cause suffocation.
171. (b) : Amniocentesis is a foetal sex determination and disorder test based on the chromosomal pattern in the amniotic fluid surrounding the developing embryo. It is withdrawal of a sample of the amniotic fluid surrounding the embryo in the uterus by piercing the amniotic sac through the abdominal wall. Amniotic fluid drawn from the uterus contains cells from the embryo (mostly shed from the skin). Cell cultures enable chromosome patterns to be studied so that prenatal diagnosis of chromosomal abnormalities (such as Down's syndrome) can be made. Metabolic errors and other diseases such as spina bifida, can also be diagnosed prenatally from the biochemistry of the cells.
172. (d) : Primary sporogenous cell gives rise to microspore mother cells or pollen mother cells (PMCs). They are sporophytic in nature i.e., diploid. These cells undergo meiosis (reduction division) which gives rise to 4 microspores or pollens and this formation of microspores or pollens is called microsporo-genesis. Microspores represent the beginning of the gametophytic phase and they are haploid in nature.
173. (b) : Nucleus is the controlling centre of a cell as it contains chromosomes and genes. Chromosomes contain the DNA which by transcription prepare RNA which in turn leads to the formation of proteins by translation. These proteins regulate

the various metabolic processes going in the cell. Besides this, nucleus contains genetic information for reproduction, development & behaviour of an organism.

Nuclear membrane is double layered, semipermeable and is perforated by minute, circular nuclear pores. The pore controls the passage of macromolecules like tRNAs, mRNAs, ribosomal proteins, enzymes etc. during different processes of transcription, translation etc.

174. (a): Calcitonin or thyrocalcitonin is secreted by parafollicular cells of thyroid stroma. It retards bone dissolution and stimulates excretion of calcium in urine. Thus, it lowers calcium level in extra cellular fluid (ECF). Parathormone is secreted by chief cells of parathyroid gland and is also known as Collip's hormone. It maintains blood calcium level by increasing its absorption from food in intestine and its reabsorption from nephrons in the kidney. Maintenance of proper calcium level is in fact, a combined function of parathormone and calcitonin. When calcium level falls below normal then parathormone maintains it by promoting its absorption, reabsorption and also by demineralization of bones. When blood calcium level exceeds above normal then calcitonin hormone increases excretion of calcium in urine.
175. (d) : Dark reaction is also known as light-independent phase. Unlike, light reaction, it does not require light as an essential factor. Thus can take place both in the presence or absence of light. The term dark reaction does not mean that it takes place only in dark period or at night. CO_2 fixation occurs in both C_3 and C_4 cycle. In C_3 cycle, CO_2 is added by the enzyme, RuBisCo to a 5 carbon compound RuBP that is converted to 2 molecules of 3-carbon PGA. In C_4 cycle the first product of CO_2 fixation (takes place in mesophyll) is a 4-carbon compound, oxaloacetic acid. It is seen in some tropical plants.
176. (c): The lightest atoms of nitrogen, carbon etc. formed the primitive atmosphere. Hydrogen atoms were most numerous and most reactive in primitive atmosphere. Hydrogen atoms combined with all oxygen atoms to form water leaving no free oxygen. Thus primitive atmosphere was reducing atmosphere (without free oxygen) unlike the present oxidising atmosphere (with free oxygen).

Formation of ozone layer is the consequence of modern oxidizing atmosphere having plenty of free oxygen. As more oxygen accumulated in the atmosphere (due to photosynthesis) ozone began to appear in the top layers.

177. (b) : The fossil of Java Ape-man was discovered from pleistocene rocks in central Java. The fossil of Peking man was discovered from the lime stone caves of Choukoutien near Peking while that of Heidelberg man was discovered in mid pleistocene. All these three fossils come under the category of *Homo erectus*.

Homo erectus appeared about 1.7 million years ago in middle pleistocene. *H. erectus* evolved from *Homo habilis*. He was about 1.5–1.8 metres tall. He had erect posture. His skull was flatter than that of modern man. He had protruding jaws, projecting brow ridges, small canines and large molar teeth. He made more elaborate tools of stones and bones, hunted big game and perhaps knew use of fire.

178. (b) : Hydrostatic pressure is the pressure which develops in an osmotic system due to osmotic entry or exit of water from it.

Loss of water produces a negative hydrostatic pressure or tension. It develops in xylem due to loss of water in transpiration. This is very important in transport of sap over long distances in plants.

A positive pressure develops in a plant cell or system due to entry of water into it. Positive hydrostatic pressure is also called turgor pressure. Due to turgor pressure the protoplast of a plant cell wall press the cell wall to the outside. The cell wall, being elastic, presses the protoplast with an equal and opposite force. The force exerted by the cell wall over the protoplast is called wall pressure (WP). Normally wall pressure is equal

and opposite to turgor pressure except when the cell becomes flaccid.

179. (d) : Hyaluronidase, a hydrolytic enzyme is an acrosomal content in mammalian sperm. It helps at the time of fertilization during the penetration of sperm into ovum. Based on the amount of yolk mammalian eggs are alecithal means egg without yolk. Microlecithal eggs are with very little yolk e.g., sea urchin, starfish. On the basis of distribution of yolk telolecithal eggs are those eggs in which the yolk is concentrated towards the vegetal pole and cytoplasm and nucleus lie near the animal pole e.g., birds and reptiles.

180. (c) : The law of segregation states that the two alleles controlling each character maintain identity in the organism but during the formation of gametes or spores by meiosis move apart due to separation of the homologous chromosomes which bear them, so that each gamete or spore receives only one allele of each character on random basis. Since the gametes or spores possess one allele of each character, they are always pure. The law of segregation is, therefore, also called the law of purity of gametes/spores. Mendel's second law or the law of independent assortment states that the alleles of different characters located in different pairs of homologous chromosomes are independent of one another in their segregation during gamete formation and in coming together into the offspring by fertilization, both processes occurring randomly.
